

ABSTRACT

There are provided a recording liquid that produces high-quality images having a very high image density and water resistance without blotting or permeating into recording paper, and excels in discharging properties; and a method for recording images by the use of such a solution. The recording liquid for ink printers according to the present invention contains a colorant, water, and a fine particle of non-photo-curable resin and a fine particle of photo-curable resin. The method for recording images on a recording medium has the step of discharging the droplets of the recording liquid from a recording head, wherein the above recording liquid is used as the recording liquid.
